D.
REGISTRATION NUMBER: 30,930
REFERENCE/DOCKET NUMBER: DART
TELECOMMUNICATION INFORMATION:
TELEPHONE: (610)470-0700
TELEPAX: (610)470-0701
INFORMATION FOR SEQ ID NO: 26:
SEQUENCE CHARACTERISTICS:
                                                                                                                                                                                        Sequence 26, Application US/08462390B
Patent No. 5882894
GENERAL INFORMATION:
APPLICANT: Smith, K. A., & Beadling, C.
TITLE OF INVENTION: Nucleic Acids Encoding CR8 Polypeptide, Vector and TITLE OF INVENTION: Transformed Cell Thereof, and Expression Thereof NUMBER OF SEQUENCES: 35
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ratner & Prestia
ZIP: 19482
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
COFTWARE: Patentin Release #1.0, Ve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TYPE: peptide

Patent No. 6057427

GENERAL INFORMATION:
APPLICANT: Smith, Kendall A. & Beadling, Carol
TITLE OF INVENTION: Nucleic Acids Encoding CRS
TITLE OF INVENTION: Delypeptide, Vector and Transformed Cell Thereof,
TITLE OF INVENTION: Expression Thereof
NUMBER OF SEQUENCES: 38
CORRESPONDENCE ADDRESS:
ADDRESSE: PRETTY, SCHROEDER & POPLAMSKI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches 311; Conservative

GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: KAPELIEY, ROSANA
TITLE OF INVENTION: NOVEL MOLECULES OF THE
FITLE OF INVENTION: AND USES THEREOF
FILE REFERENCE: 035800/175631
CURRENT APPLICATION NUMBER: US/09/644,450
CURRENT FILING DATE: 2000-08-23
NUMBER OF SEQ ID NOS: 11
SOFTWARE: Patentin Ver. 2.0
SEQ ID NO 7
LENGTH: 313
TYPE: PRT
ORGANISM: Mus musculus
US-09-644-450-7
                                          Sequence 41, Application US/07857224B
Patent No. 5958784
GENERAL INFORMATION:
APPLICANT: Benner, Steven A.
TITLE OF INVENTION: Predicting Folded St.
NUMBER OF SEQUENCES: 114
CORRESPONDENCE ADDRESS:
ADDRESSEE: Steven A. Benner

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score

The present sequence is the protein sequence of human Piml, a protein related to tyrosine threonine kinase (TTK, see ABP54938). TTK polynucleotides and polypeptides of the invention encompass polynucleotides and polypeptides having sequence similarity or sequence identity to human TTK and other genes and gene products related to TTK, such as Piml. The invention is based on the finding that TTK is differentially expressed in various forms of cancer. It provides methods for the identification of cancerous cells, especially breast cancer and colon cancer cells, by detection of expression levels of TTK, as well as

Reducing growth of cancer cells comprises reducing Tyrosine Threonine Kinase (TTK) activity, useful in diagnosing and treating disorders with abnormal expression levels and activity of TTK, such as lung, colon, prostate and ovarian cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diagnostic, prognostic and therapeutic methods. These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK are also
                            Modulating levels or activity of HKID-1 polypeptides, a member of serine/threonine kinase superfamily, for treating cancer, by contacting cell expressing the polypeptide with a modulator of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                            04-OCT-2001; 2001US-00971791.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a method of modulating the level or activity of human HKID-1 polypeptide, a member of serine/threonine kinase superfamily. The method involves contacting a cell expressing the polypeptide or nucleic acid with an agent to modulate the level or activity of polypeptide, or level of nucleic acid molecule. The method i useful for modulating the level or activity of HKID-1 polypeptide or polynucleotide in a subject having or predisposed to having a disorder involving cancer. Modulating HKID-1 expression or activity is useful for therapeutic purposes, for treating cellular proliferative and/or differentiative disorders including cancer or haematopoietic neoplastic disorders e.g. Acute promyeloid leukaemia (APML), Chronic myelogenous leukaemia (CML) and Waldenstrom's macroglobulinaemia (WM). This is the amino acid sequence of a human protein kinase phosphorylation site
                                                                                                                                                                                                                                                                                                                                    WO200293173-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        11-AUG-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          compounds, involving screening candidate compounds for interaction with PIM1 or PIM3 kinase. PIM1 and PIM3 proteins and coding sequences are useful for treating chronic pain, particularly of neuropathic or inflammatory origin (e.g. where associated with diabetes, cancer, AIDS neurodegenerative diseases). The present sequence is human PIM1 kinase

normal is indi ing cancer in a subject, by comparing expression levels of tyrosine ine kinase polypeptide or polynucleotide in a subject cell and a cell, where an increase in the expression level in the test cell

Disclosure; Page 34-35; 79pp; English.

CC threonine kinase (TTK, a mirotic checkpoint gene) polypeptide or polynucleotide in a test cell obtained from the subject and in a normal connectate cell, where an increase in the expression levels of tyrosine connectates the presence of cancer other than ovarian cancer and in a normal connectates the presence of cancer other than ovarian cancer. Also included are reducing growth of a cancerous cell (by contacting a cancerous cell contacting a cancerous cell (contacting a cancerous cell (provided activity of a growth of a cancerous cell (comprising: (i) detecting the activity of TTK polypeptide in the presence of a candidate agent that reduces capent), identifying an agent that reduces TTK activity of a contacting a cancerous cell (comprising: (i) detecting the activity of TTK polypeptide activity in the absence of a candidate agent capent; in its polypeptide activity in the absence of the candidate agent (contacting a cancerous cell displaying elevated expression of a TTK contacting a cancerous cell displaying elevated expression of a TTK contacting a cancerous disease other than ovarian cancer in a contacting a cancerous disease other than ovarian cancer in a contactivity of expression of TTK -encoding polynucleotide in a test cancer cell where the level of expression of TTK in the test cancer cell with prognosis of the polynucleotide in the cancerous disease). The methods are cell creduces growth of a cancerous cells, identifying an agent that cancer cell creduces growth of a cancerous cells, identifying a candidate agent that control non-cancer cell is condicative of the prognosis of the polynucleotide in the test cancer cell creduces growth of a cancerous cells, identifying an agent that reduces TTK condicative of the prognosis of the cancerous disease). The methods are creduced to the cancer cell is condicated the reduces TTK condicated to respond to a particular therapy expension of the cancerous disease other than cancer cell creduced to the cancer cell is condicated to the cancer cell is condicated t The invention relates to detecting cancer (other than ovarian can a subject, comprising comparing the expression levels of tyrosine cancer) ij

                                                                                                                                                                                                                                                                                           The present sequence is the protein sequence of the human serine/threonine protein kinase and proto-oncogene, PIM-1. PIM-1 proteins are the paralogues of novel human and murine PIM-3 proteins (see ABR62932 and ABR62933) of the invention, which are therefore expected to be involved in cancer and cell growth regulation. PIM-3 is also involved in the development of insulin resistance and type 2 diabetes mellitus. The invention relates to the use of PIM-3 nucleic acids and proteins in: screening assays for compounds that modulate insulin resistance or type 2 diabetes mellitus (e.g. chromosomal mapping, tissue typing, forensic biology); predictive medicine (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. diagnostic or prognostic assays, monitoring clinical trials, pharmacogenomics); and for the preparing a medicament for the treatment of insulin resistance or type 2 diabetes mellitus (e.g. diagnostic or prognostic assays).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New
                                                                                                                                                                                                                                                     Sequence 313
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 2; Page 40; 40pp; English.
